	0147 164 100	Glen Innes
	0147 166 231	Tenetfield

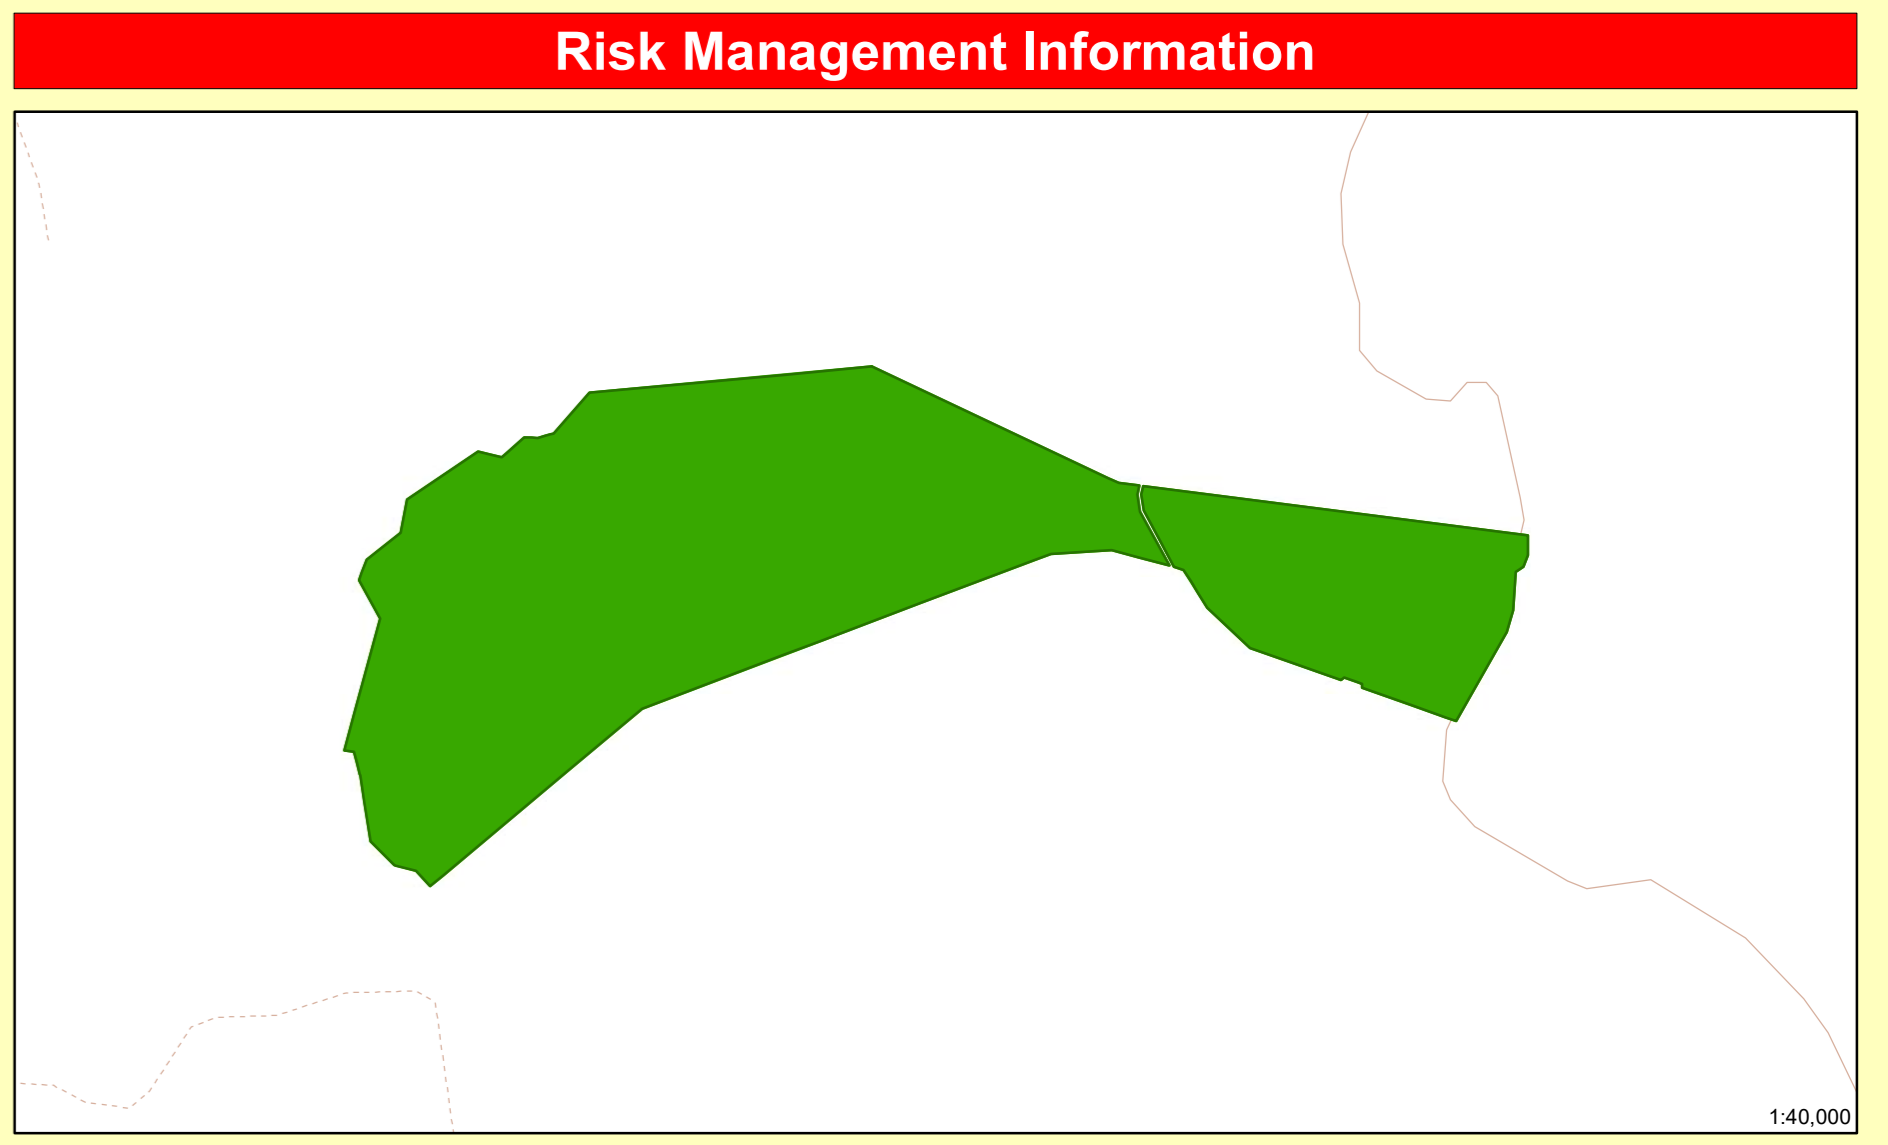

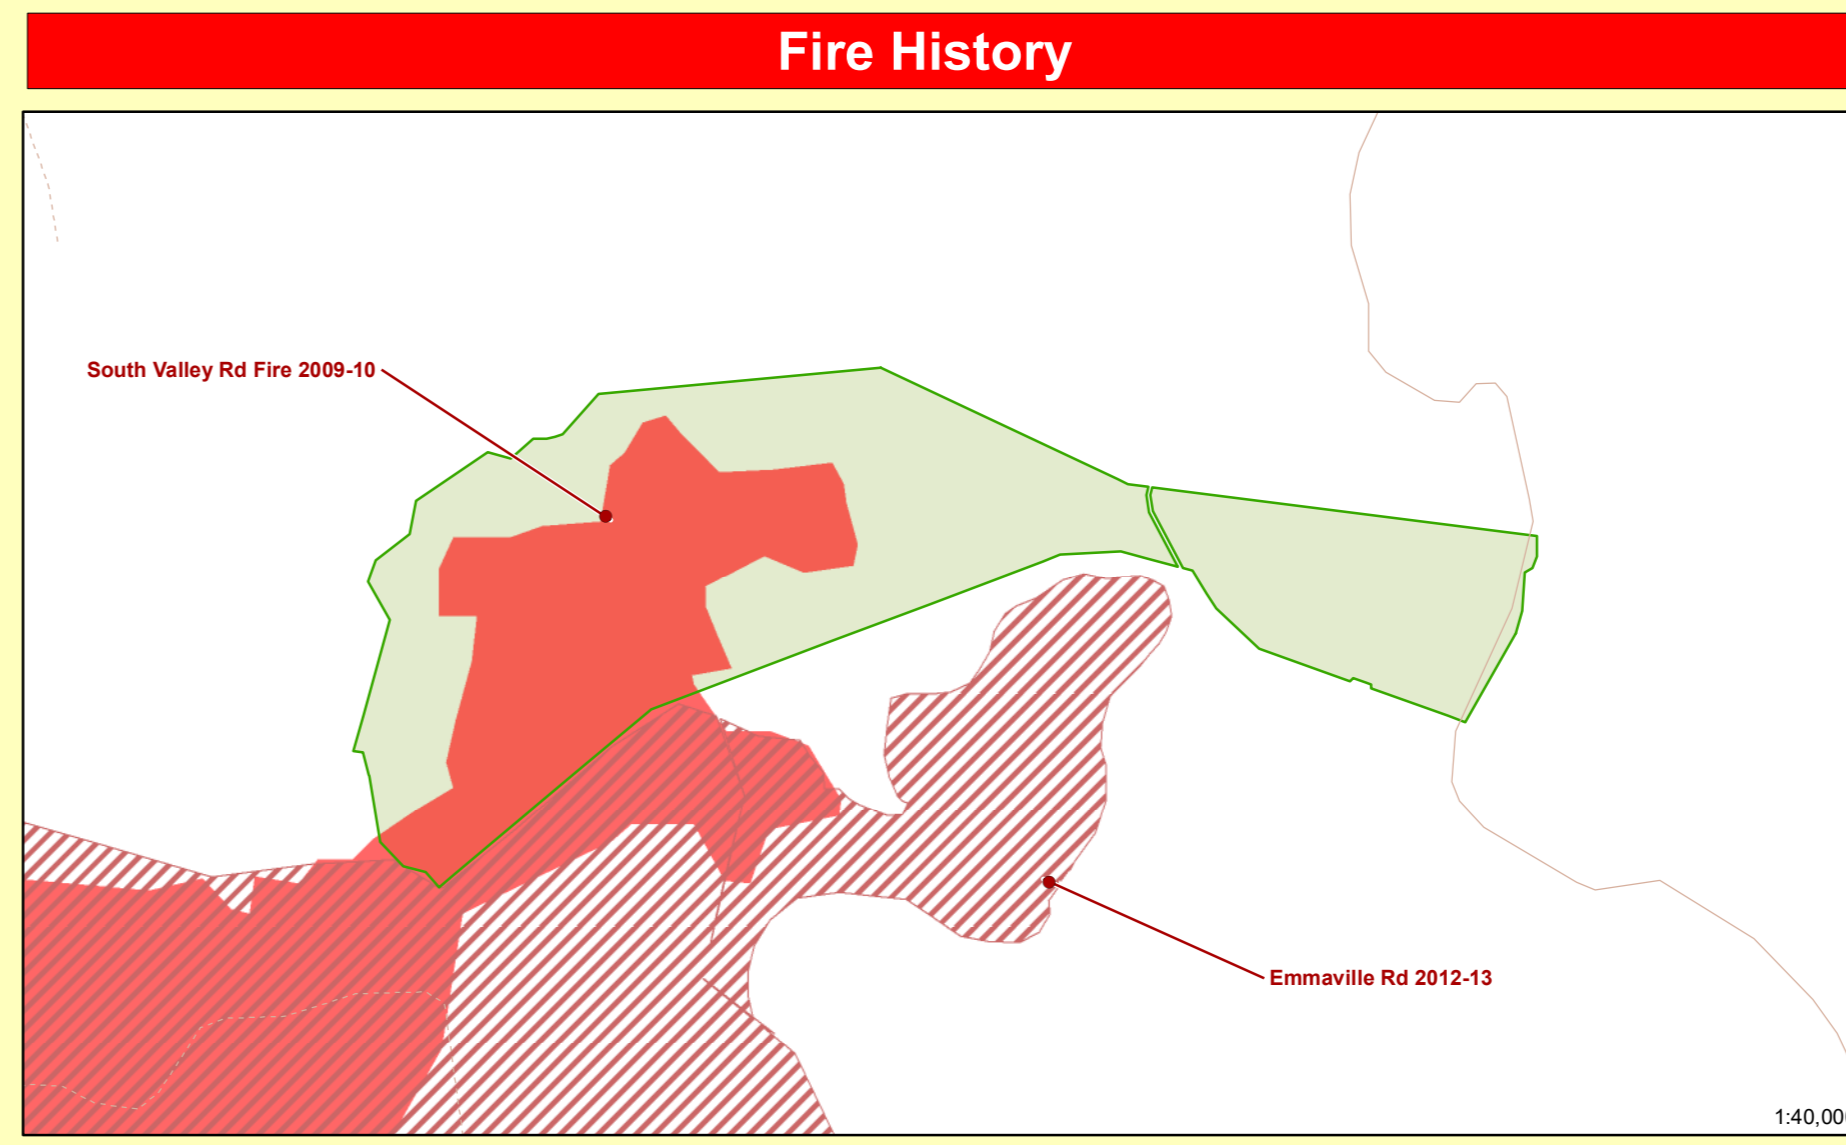

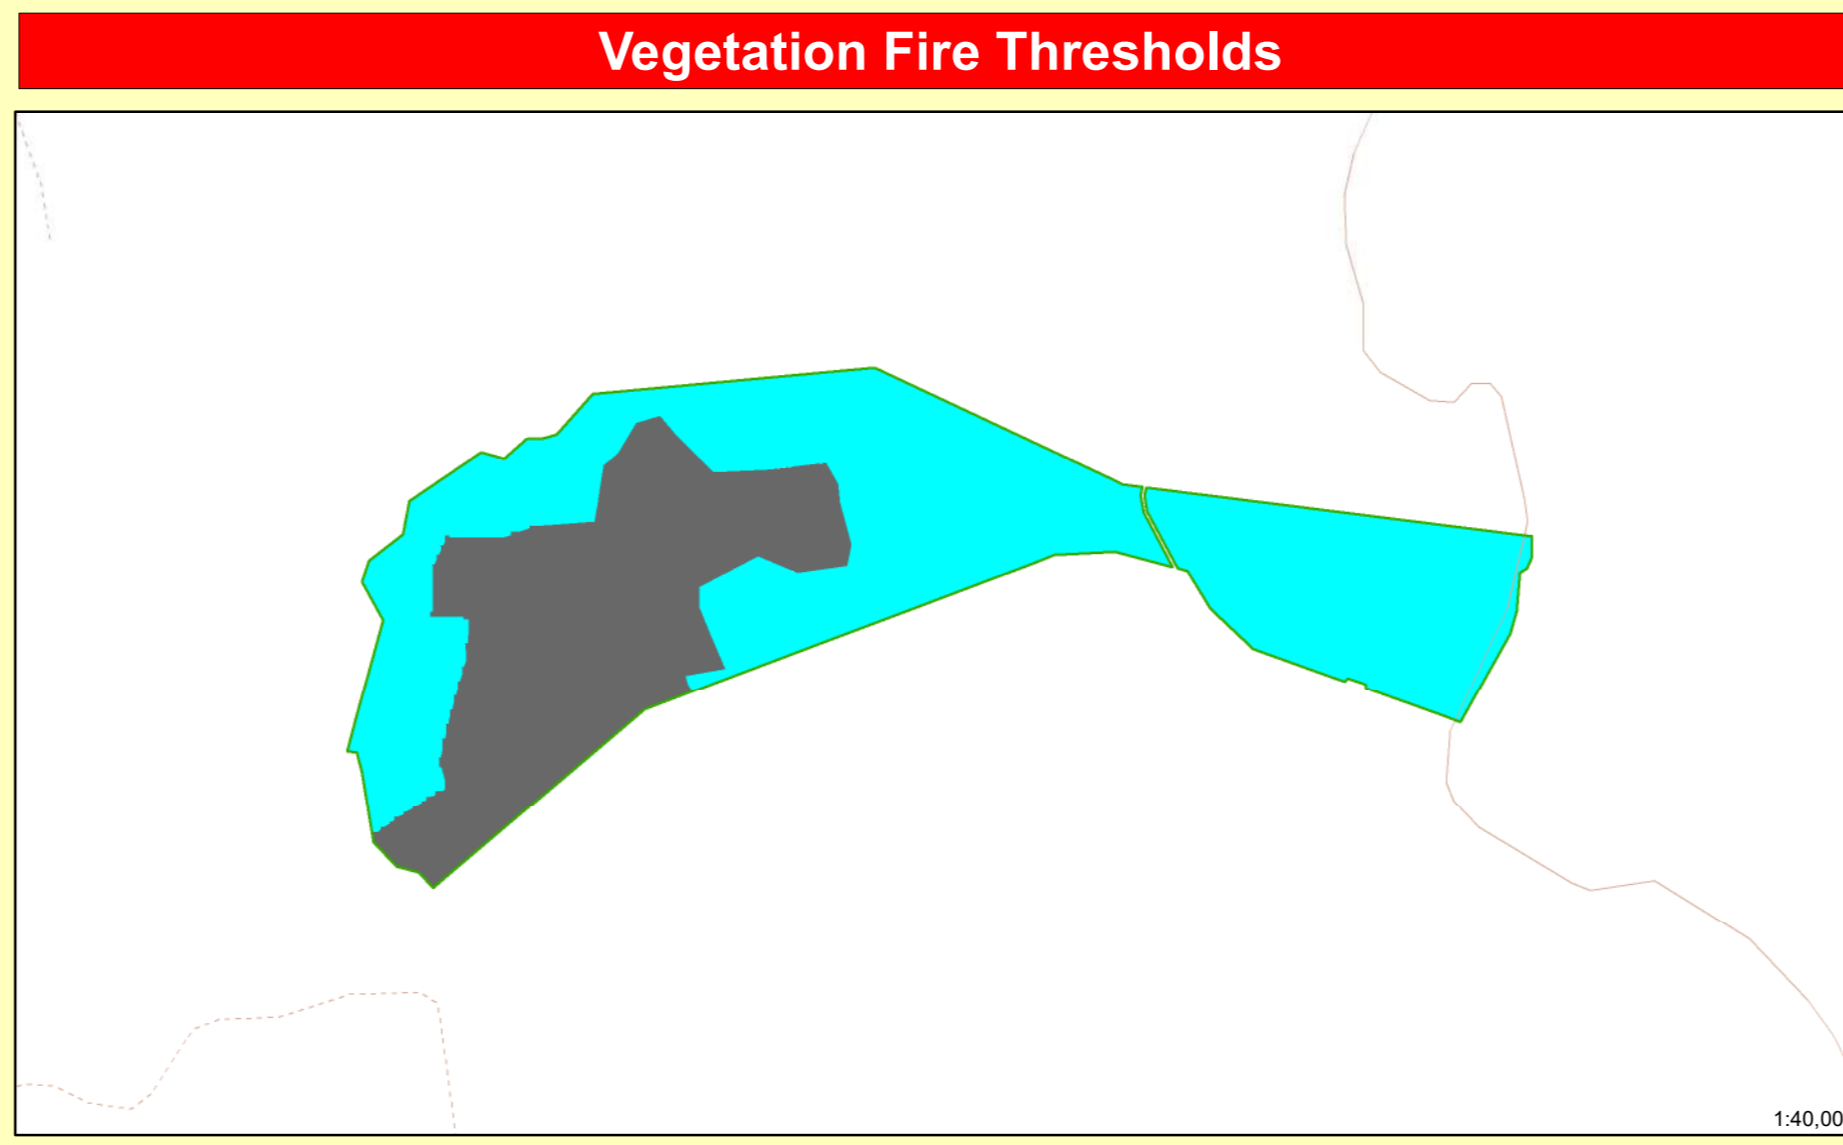

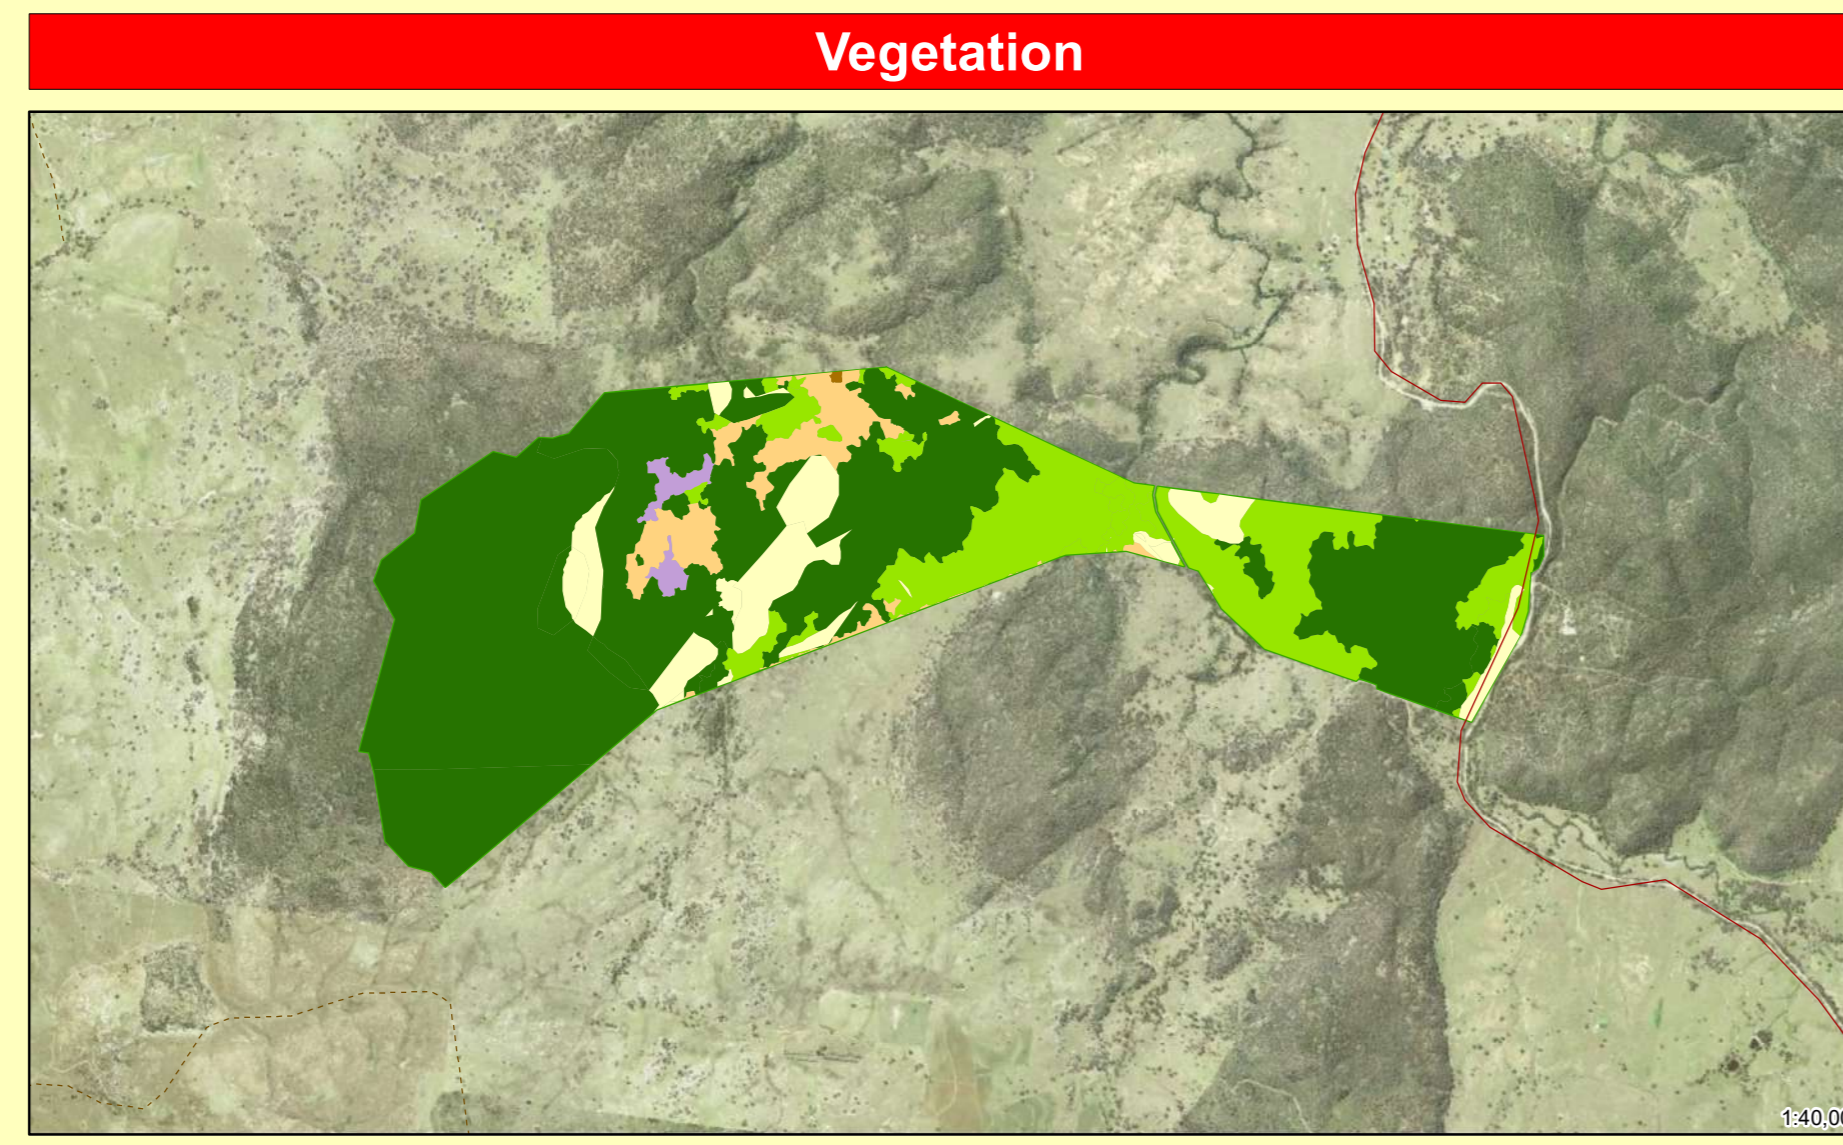

Fire Season Information	
<b>Wildfires</b>	The critical wildfire season occurs during October to December, but wildfires can occur as early as August. The fire season may extend into the first half of January in drier than normal years. During this period in dry seasons fires may exhibit high intensity behaviour under worst conditions.
<b>Prescribed Burning</b>	Effective prescribed burning normally occurs Autumn to late Winter. Burning is possible in early spring only when surface and soil surface levels are high but conditions are not too hot and dry. Conditions are not suitable for burning in late spring when temperatures are cold. By late spring hazard reduction burns are not desirable as fire may not burn hot.

Operational Guidelines	
<b>Aerial Operations</b>	<ul style="list-style-type: none"> <li>Aerial operations will be managed by trained and competent personnel. This includes directing aerial bombing and aerial ignition operations.</li> <li>The use of bombing aircraft should support containment operations by aggressively attacking hotspots and spot fires.</li> <li>The use of bombing aircraft without the support of ground-based suppression crews should be limited to very specific circumstances.</li> <li>Where practicable foam should be used to increase the effectiveness of the water.</li> <li>Ground crews must be alerted to water bombing operations.</li> <li>All aerial ignition operations require the consent of a senior NPWS officer or the Section 44 Approver.</li> </ul>
<b>Backburning</b>	<ul style="list-style-type: none"> <li>Backburning from existing fire boundaries should be the preferred suppression method but due to the slope, aspect and access of the Park - fire suppression is to be managed from Park boundaries in cleared country.</li> <li>All personnel must be fully briefed before back burning operations begin.</li> <li>Backburning in areas of Low - Moderate OFPI will require the use of wind, or low humidity to maximise effectiveness.</li> <li>Aerial ignition may be used during backburning or fuel reduction operations where practicable, but only with the prior consent of a senior NPWS officer.</li> <li>Utilise incinerators to rapidly progress backburns down slope where required.</li> </ul>
<b>Command &amp; Control</b>	<ul style="list-style-type: none"> <li>The first combat agency on site may assume control of the fire, but then must ensure the relevant land management agency is notified and liaised with promptly.</li> <li>The initial Incident Controller must notify the RP-S to ensure that the agency in command is determined and an Incident Controller is appointed to ensure coordinated firefighting.</li> </ul>
<b>Containment Lines</b>	<ul style="list-style-type: none"> <li>During Extreme + FHR containment should be undertaken on the boundary of the Park adjacent to cleared country.</li> <li>Existing natural fire control advantages should be used as or linked into fire control lines, this includes any area of natural feature that could support the fire and/or assist the passage of the fire.</li> <li>Construction of new containment lines should be avoided, where practicable, except where they can be constructed with minimal environmental impact and prior consent of a senior NPWS officer.</li> <li>All personnel involved in containment line construction should be briefed on and must consider both natural and cultural heritage sites in the location.</li> <li>All containment lines not required for other purposes should be closed immediately at the cessation of the incident and where necessary, rehabilitation or re-vegetation will be undertaken.</li> <li>Conditions apply to use heavy plant equipment within NPWS managed lands to maintain conservation values and meet environmental legislative requirements. Plant may only be used with the prior consent of a senior NPWS Officer.</li> <li>Heavy plant equipment must always be guarded and supervised on site by an experienced NPWS officer in a support vehicle. When engaged in direct or parallel attack, the vehicle must be a fire fighting vehicle.</li> <li>Heavy plant must be washed down, where practicable, prior to entering NPWS estate and again on exiting NPWS estate.</li> </ul>
<b>Hazard Reduction Burning</b>	<ul style="list-style-type: none"> <li>Land Management Zones are managed to achieve fire protection objectives through prescribed burning to create a variety of fuel load structures and a mosaic of age classes within the landscape and to provide optimum fire frequencies required for the vegetation communities.</li> <li>Since the acquisition of this park in 2011 there have been no fires. The fire history prior to this period is limited mostly to 2005/06 wildfire with recorded fire intensity in the moderate burning approximately 25 tpa.</li> </ul>
<b>Fire Suppression Chemicals</b>	<ul style="list-style-type: none"> <li>All fire chemicals used on NPWS estate by NPWS staff, and/or other agencies or personnel, must be approved under the United States Department of Agriculture (USDA) Wildland Fire Chemical System (WFCS).</li> <li>When undertaking aerial application of firefighting chemicals, their application is not to be within 100m of a waterbody.</li> <li>Where necessary, a post-fire rehabilitation plan should be initiated as early as possible during the incident and be approved in the IAP by the IC.</li> </ul>
<b>Rehabilitation</b>	<ul style="list-style-type: none"> <li>Post fire rehabilitation involves the identification of disturbances, assessment of rehabilitation options, determination, and implementation of the most effective rehabilitation option. Monitoring the results of rehabilitation is required.</li> </ul>
<b>Water Points</b>	<ul style="list-style-type: none"> <li>There are no water points within the park. Deployment of a bulk water carrier and buoy walls will be required to support fire operations.</li> </ul>
<b>Smoke Management</b>	<ul style="list-style-type: none"> <li>Potential smoke impacts can occur on neighbours and, as such, mitigation tactics will be assessed during the planning of fire operations.</li> </ul>
<b>Visitor Management</b>	<ul style="list-style-type: none"> <li>There is currently no public access to the park and no visitor facilities.</li> <li>In Extreme + Fire Danger Rating at the Branch Director's discretion, the reserve may be closed. Ensure the closure is advertised on the NPWS website.</li> </ul>
<b>WARNINGS</b>	<ul style="list-style-type: none"> <li>During Extreme + FHR containment should be undertaken on the boundary of the Park adjacent to cleared country so that escape is available.</li> <li>There are some tracks but no fire trails within the park.</li> <li>Revoke country.</li> </ul>

Heritage Guidelines	
<b>Aboriginal Cultural Heritage</b>	<ul style="list-style-type: none"> <li>There are no Aboriginal sites recorded in Crooked Creek National Park.</li> <li>ARMS databases must be checked as part of planning for fire operations.</li> </ul>
<b>Historic Sites</b>	<ul style="list-style-type: none"> <li>There are no historic sites recorded in Crooked Creek National Park.</li> <li>ARMS databases must be checked for fire planning operations.</li> </ul>
<b>Threatened Fauna &amp; Flora</b>	<ul style="list-style-type: none"> <li>Brown Tree Creeper (conservation program reserves) is the only vulnerable species recorded within Crooked Creek National Park. This species is listed in NSW as vulnerable in the Biodiversity Conservation Act 2016 and protected under the National Parks and Wildlife Act 1974. Due to this species' mobility it should not be considered a high priority for fire planning operations.</li> <li>Other threatened fauna species recorded within five kilometres and that may occur within the park include: border thick-billed parakeet (Lathrotruptus aeneus), brush-tailed rock-wallaby (Petrogale penicillata), diamond firetail (Diaparsoria guttata), eastern berrigan-bill (Micrositta arborea), eastern whistler (Pachycephala pectoralis), greater berrigan-bill (Dicaeops sp.), koala (Phascolarctos ursinus), little lorikeet (Chrysomitris australis), scarlet robin (Eopsaltria australis), spotted warbler (Chrysomitris spilata), square shrike (Phaps elegans), sulphur bellbird (Heteractitis jayakii) and varied sitta (Lathrotruptus aeneus).</li> <li>TLC Yellow-bill Yellow-bill (Chrysomitris spilata) is located along Crooked and Bourghard Creeks.</li> </ul>
<b>Soil Erosion Management</b>	<ul style="list-style-type: none"> <li>The soils within the reserve are generally stable. Sheep pasture is susceptible to erosion after disturbance.</li> <li>The Park falls under the Bush Fire Environmental Assessment Code (BFEAC) and is divided into three categories 1, 2, and 3 of fire categories. Categories 1, 2, and 3 are of lower risk. All works are to be consistent with the requirements of the categories specified. Soil erosion risk categories are in accord with the Departmental Codes and Notes for Application of Soil Erosion Risk for the BFEAC.</li> </ul>

Suppression Strategies	
<b>Guidelines</b>	<ul style="list-style-type: none"> <li>Community - Plan and prepare.</li> <li>Direct attack to minimise fire loss.</li> <li>Consider a broad containment strategy using natural containment advantages of Crooked Creek and Bourghard Creeks, and Crooked Creek Road. Allow long-term management requirements for biodiversity.</li> <li>Community - Be ready to act.</li> <li>Close parallel or direct attack may be an option at night depending on weather conditions.</li> <li>Distance between the tank and machinery and the units should be kept to a minimum.</li> <li>Secure and defend containment lines on the next predicted downward side of the fire.</li> <li>Major require aerial support to manage spot fires and monitor fire spread.</li> <li>Community - Take action now to protect life and property.</li> <li>Firefighter safety is the paramount consideration in deployment.</li> <li>Undertake broad containment strategies using the park boundary and neighbouring cleared country.</li> <li>Close parallel or direct attack may be an option at night depending on weather conditions.</li> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> </ul>
<b>Intent:</b>	Due to the remoteness and no internal fire trails, access is difficult. Early RAFF response has proven effective in suppressing small fires. Aerial reconnaissance and RAFF deployment may be considered as effective options to new ignitions and lightning strikes, dependent on location within the park and the Fire Danger Rating.
<b>All vegetation types</b>	

Fire Danger Rating	Guidelines
<b>Moderate</b>	<ul style="list-style-type: none"> <li>Community - Plan and prepare.</li> <li>Direct attack to minimise fire loss.</li> <li>Consider a broad containment strategy using natural containment advantages of Crooked Creek and Bourghard Creeks, and Crooked Creek Road. Allow long-term management requirements for biodiversity.</li> </ul>
<b>High</b>	<ul style="list-style-type: none"> <li>Community - Be ready to act.</li> <li>Close parallel or direct attack may be an option at night depending on weather conditions.</li> <li>Distance between the tank and machinery and the units should be kept to a minimum.</li> <li>Secure and defend containment lines on the next predicted downward side of the fire.</li> <li>Major require aerial support to manage spot fires and monitor fire spread.</li> <li>Community - Take action now to protect life and property.</li> <li>Firefighter safety is the paramount consideration in deployment.</li> <li>Undertake broad containment strategies using the park boundary and neighbouring cleared country.</li> <li>Close parallel or direct attack may be an option at night depending on weather conditions.</li> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> </ul>
<b>Extreme</b>	<ul style="list-style-type: none"> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> </ul>
<b>Catastrophic</b>	<ul style="list-style-type: none"> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> <li>Community - Take action now to protect life and property.</li> </ul>

Vegetation Formation	Vegetation Management Guidelines	Fire Behaviour
<b>Dry Sclerophyll Forests (Shrubby Sub-Formation)</b>	<ul style="list-style-type: none"> <li>The minimum interval between low intensity fires is more than 5 years.</li> <li>High intensity fires within fire intervals of 7 years (12 years if Cottons is present).</li> <li>The maximum fire interval is 40 years.</li> <li>Many of these sites are small areas surrounded by other more extensive bush communities. The fire regimes in these surrounding vegetation types will to a large extent dictate the fire regimes in the reserve.</li> </ul>	<ul style="list-style-type: none"> <li>The potential rates of spread during extended dry season can be very high due to terrain factors. Overall Fuel Hazard is normally in the range of Moderate to Very High.</li> <li>Spotting associated with wind-blown fire can be severe.</li> <li>OFPI is highly dependent on time since fire. The potential rates of spread vary from Moderate to Very High depending on OFPI.</li> </ul>
<b>Dry Sclerophyll Forests (Grassy Sub-Formation)</b>	<ul style="list-style-type: none"> <li>A diversity of fire intervals across the local landscape should be maintained.</li> <li>Avoid the intervals of less than 7 years and more than 35 years.</li> <li>Avoid high intensity fires within fire intervals of 7 years (12 years if Cottons is present).</li> <li>The maximum fire interval is 40 years.</li> <li>Many of these sites are small areas surrounded by other more extensive bush communities. The fire regimes in these surrounding vegetation types will to a large extent dictate the fire regimes in the reserve.</li> </ul>	<ul style="list-style-type: none"> <li>Potential rates of spread are dependent on seasonal conditions.</li> <li>Low OFPI and hence low rates of spread occur in dry years.</li> <li>Moderate to High OFPI may develop after successive wet seasons producing continuous ground cover. In these conditions potential rates of spread may be Moderate to Very High.</li> <li>Potential rates of spread are high due to the grassy nature of the landscape.</li> </ul>
<b>Forested wetlands</b>	<ul style="list-style-type: none"> <li>The minimum fire interval in healthy stands of these grey woodlands is 5 years.</li> <li>Where the health of the woodlands is compromised through drought, the minimum fire interval should be increased to 10 years.</li> <li>Avoid the intervals of less than 7 years and greater than 30 years.</li> <li>A diversity of fire intervals across the local landscape should be maintained.</li> </ul>	<ul style="list-style-type: none"> <li>Potential rates of spread are dependent on seasonal conditions.</li> <li>Low OFPI and hence low rates of spread occur in dry years.</li> <li>Moderate to High OFPI may develop after successive wet seasons producing continuous ground cover. In these conditions potential rates of spread may be Moderate to Very High.</li> <li>Potential rates of spread are high due to the grassy nature of the landscape.</li> </ul>
<b>Grasslands</b>	<ul style="list-style-type: none"> <li>The minimum fire interval in healthy stands of these grey woodlands is 5 years.</li> <li>Where the health of the woodlands is compromised through drought, the minimum fire interval should be increased to 10 years.</li> <li>Avoid the intervals of less than 7 years and greater than 30 years.</li> <li>A diversity of fire intervals across the local landscape should be maintained.</li> </ul>	<ul style="list-style-type: none"> <li>Potential rates of spread are dependent on seasonal conditions.</li> <li>Low OFPI and hence low rates of spread occur in dry years.</li> <li>Moderate to High OFPI may develop after successive wet seasons producing continuous ground cover. In these conditions potential rates of spread may be Moderate to Very High.</li> <li>Potential rates of spread are high due to the grassy nature of the landscape.</li> </ul>
<b>Green woodlands</b>	<ul style="list-style-type: none"> <li>The minimum fire interval in healthy stands of these grey woodlands is 5 years.</li> <li>Where the health of the woodlands is compromised through drought, the minimum fire interval should be increased to 10 years.</li> <li>Avoid the intervals of less than 7 years and greater than 30 years.</li> <li>A diversity of fire intervals across the local landscape should be maintained.</li> </ul>	<ul style="list-style-type: none"> <li>Potential rates of spread are dependent on seasonal conditions.</li> <li>Low OFPI and hence low rates of spread occur in dry years.</li> <li>Moderate to High OFPI may develop after successive wet seasons producing continuous ground cover. In these conditions potential rates of spread may be Moderate to Very High.</li> <li>Potential rates of spread are high due to the grassy nature of the landscape.</li> </ul>
<b>Heathlands</b>	<ul style="list-style-type: none"> <li>The minimum fire interval in healthy stands of these grey woodlands is 5 years.</li> <li>Where the health of the woodlands is compromised through drought, the minimum fire interval should be increased to 10 years.</li> <li>Avoid the intervals of less than 7 years and greater than 30 years.</li> <li>A diversity of fire intervals across the local landscape should be maintained.</li> </ul>	<ul style="list-style-type: none"> <li>Potential rates of spread are dependent on seasonal conditions.</li> <li>Low OFPI and hence low rates of spread occur in dry years.</li> <li>Moderate to High OFPI may develop after successive wet seasons producing continuous ground cover. In these conditions potential rates of spread may be Moderate to Very High.</li> <li>Potential rates of spread are high due to the grassy nature of the landscape.</li> </ul>

Vegetation Threshold	Treatment
<b>Too Frequent Burnt</b>	Fire thresholds have been exceeded. Protect from fire as far as possible.
<b>Vulnerable to Frequent Fire</b>	The current interval since last fire is shorter than the recommended minimum interval.
<b>Within Threshold</b>	Fire history is within the threshold for vegetation in this area. A burn is neither required nor should one necessarily be avoided.
<b>Long Unburnt</b>	Fire frequency is below fire thresholds in the area. A prescribed burn may be advantageous. Consider allowing unplanned fires to burn.
<b>Unknown</b>	Insufficient data to determine fire threshold.
<b>No Regime Assigned</b>	Areas which do not have recommended fire intervals assigned to them or cleared land, rock.
<b>NS Fire thresholds are defined for vegetation communities to conserve biodiversity</b>	

Fire Type	Fire Details
<b>Prescribed Burn</b>	No prescribed burns undertaken.
<b>Wildfire</b>	<p>2012 / 13 - Emmanville Rd Fire - This wildfire did not enter the Park. It was contained off-Park on the southern boundary.</p> <p>2009 / 10 - South Valley Rd Fire - Fire came from the south and entered the Park burning the middle of the western half of the reserve approximately 251 ha.</p>

Fire Management Zone	Treatment
<b>Asset Protection Zones</b>	The objective of APZs is the protection of human life and property. This will have precedence over guidelines for the management of biodiversity. Maintain Overall Fuel Hazard at Moderate or below.
<b>Strategic Fire Advantage Zones</b>	The objective of SFAZs is to reduce fire intensity in locations to assist containment of wildfires, by maintaining the Overall Fuel Hazard at HIGH or below.
<b>Land Management Zones</b>	The objective of LMZs is to conserve biodiversity and protect cultural heritage. Manage fire consistent with fire thresholds.
